

## *Introduction to Laboratory Operations*

How often have you thought – if only I knew then, what I know now? This one day Introduction to Laboratory Operations course provides a foundation to the LabSkills™ training programme and distils over 100 years knowledge and joint experience of NuLab laboratory specialists into a highly focussed day of learning that might otherwise take several years to gain.

Trainees will be given an introduction to the responsibilities of offshore chemists and the laboratory management systems that they may be required to use, with particular emphasis on quality assurance and laboratory safety management. At the end of this LabSkills™ module, trainees will have gained an overview of the wide variety of differing laboratory tests carried out on a typical platform, the different methods performed, equipment used, why the tests are performed, their importance and application to process systems.
